There you are, minding your own business, when your eye starts to spasm out of control. The figure ?? shows disadvantages. Its a very annoying feeling which can persist for hours. But is there any cause for alarm? Trinidadians have quite a rich collection of superstitions concerning jumping eyes. [1] For instance, if your right eye jumps, you are going to hear good news, and if your left eye jumps, you are going to hear bad news. Superstitions aside, the short answer is that a twitching eye is totally fine, although in some exceptional cases it may underlie a neurological condition.

(a) This is the left picture.

(b) This is the right picture.

Figure 1: This is total name.

Eye spasm is characterized by the spontaneous contractions of muscle without muscular atrophy or weakness. The table 1 summarizes bad haits. You might have experienced an involuntary muscle spasm in your knee or elbow. The same can happen to the orbicularis oculi muscle.

Table 1: Factors

Factor	Male accuracy	Female accuracy
Stress	81%	74%
Fatigue	91%	83%
Dry eyes	61%	54%

Not getting enough sleep or working too much overtime may cause your eye to complain. Scientists arent sure why, but theyve found that getting more rest will make the symptoms subside.
